Executive Summary

The Economic Impacts of CalPERS Pension Payments in 2010

For nearly 80 years the California Public Employees' Retirement System (CalPERS) has provided a secure retirement for millions of public employees. As a defined benefit pension plan with almost 2,300 staff members, the fund currently manages retirement and other benefits for more than 1.6 million active and retired public servants and their families and more than 3,000 California public employers.

CalPERS fulfills its primary mission by investing funds contributed by employees and employers then managing the investment earnings to make sure benefits are paid. Over the last 20 years CalPERS has earned an average annual rate of return of 7.9 percent. That level of investment return means that during that same two decade period earnings have accounted for more than 64 percent of the cost of payments paid in 2010 to beneficiaries. The employer share of the cost of pension benefits amounted to 21 percent and the employee share 15 percent over that same period.

In 2010 CalPERS paid nearly \$12 billion in benefits to more than 500,000 retirees, beneficiaries, and survivors. Approximately 86 percent of those annuitants live in California and spend their monthly income in the state's 58 counties. Those retired public employees and their beneficiaries are a little more than one percent of the population of California.

This study looks at the economic impact of benefit payments in 2010 to the 431,373 California resident CalPERS retirees and beneficiaries. Those payments to California residents totaled \$11,565,547,065. The analysis of CalPERS benefit payments reveals that one consequence of the system's steady performance over the years is the ancillary benefit of growing and sustaining the California economy. The dollars spent by CalPERS retirees have become a significant economic engine in most California communities.

Statewide the 2010 CalPERS benefit payments stimulated more than \$26 billion in total economic activity. That economic activity increased the gross state product in 2010 by more than \$8.6 billion. And all that economic activity supported more than 93,600 California jobs during a tough year for employment.

The increase in total economic activity is a result of the economic multiplier effect. When dollars are spent in a community each direct expenditure results in indirect and induced impacts, which then cause those dollars to stimulate further economic activity. Statewide every dollar paid to a CalPERS beneficiary results in \$2.26 in economic activity, which we call a multiplier of 2.26 for every dollar.

Because almost 80 percent of those dollars spent by beneficiaries comes from contributions by retirees and from CalPERS earnings on investments, the value of employer contributions have an enhanced benefit on the state economy. When you take into account the money earned from investments on the contributions made by employers and employees it means that each dollar paid into CalPERS by an employer resulted in \$10.79 worth of economic activity when it was paid out in benefits during 2010.

CalPERS is the largest public employee pension fund in the country with more than \$237 billion in assets under management as of June 1, 2011. The average CalPERS retiree leaves public service at 60 years old after more than 20 years on the job. The average monthly CalPERS benefit in California in 2010 was \$2,236 based on this study of 431,000 beneficiaries. Collectively those benefit payments add up to a significant investment in the California economy.

2010 Benefit Payments Impact Study Key Findings

- Direct CalPERS retirement payments to California residents in 2010 totaled \$11.566 billion. Those payments resulted in a ripple effect throughout the economy that caused an additional \$14.615 billion in induced business revenue for a total of more than \$26.181 billion in California economic activity from CalPERS retirement payments.
- The \$26.181 billion in local economic activity generated by CalPERS payments is greater than the combined impact of three fast growing universities which have released recent data: University of California San Francisco (\$6.2 billion), University of California San Diego (\$4.7 billion) and University of California Irvine (\$4.2 billion).
- The economic activity generated by CalPERS retirement payments supported 93,651 California jobs in 2010 with a total compensation of \$4.795 billion.
- If you compare the jobs generated by CalPERS retirement payments with industries, the payments accounted for more jobs than the internet publishing, livestock production, and paper manufacturing economic sectors combined.
- The CalPERS retirement payments and ripple effects stimulated economies throughout California and increased the statewide Gross Regional Product by \$8.635 billion in 2010. This is value added or new dollars generated in the economy. That amounts to almost a half of a percent increase in California's \$1.875 trillion economy.
- If you compare CalPERS' impact on the gross state product with industries it is greater than the impact of the broadcasting, oil and gas extraction, air transportation, building and garden supply, and many other sectors of the California economy in 2009 (last year with available data).
- The economic activities stimulated by CalPERS retirement payments resulted in the generation of \$1.041 billion in state and local taxes during 2010, almost \$620 million of that was in property and sales tax measurable at the county level.
- On average each taxpayer dollar directly invested in CalPERS by local and state governments generated a return on investment when benefits were paid in 2010 of \$10.79 of activity in the California economy. This return on taxpayer investment is the result of a long history of solid risk adjusted returns and the contributions of CalPERS members together accounting for almost 80% of the amount paid in benefits.
- Every California County benefits from CalPERS retirement payments. In larger urban counties impact is greatest on the total dollar amount of gross regional product. In smaller, rural counties the percentage increase in the gross regional product is greatest.
- CalPERS payments have a positive impact on jobs throughout the state and in 17 counties they supported more than one percent of the total jobs in their communities.
- When looked at across California's nine regional economies, CalPERS benefit payments have a proportionally more dramatic impact on rural and mountain regions with Central Sierra Region (7 counties) having the greatest impact of payments on gross regional product and employment.

Benefit Payments Compare to Industries in Supporting Jobs and Increasing Economic Activity

The direct payments to CalPERS beneficiaries has a significant impact on the California economy including job creation and increasing economic activity. While these payments do not constitute a separate industrial sector as established by the North American Industry Classification System (NAICS), the benefit payments have an impact on job creation similar to many industry sectors.

The employment resulting from CalPERS benefit payments in 2010 is comparable to major NAICS sectors of economic activity. CalPERS' benefits helped support more than 93,600 of California's jobs in 2010, comparable in magnitude to classifications counted in the previous year including courier and messenger services, rental and leasing services, publishing, chemical manufacturing and warehousing.

And the number of jobs supported by CalPERS retirees' expenditures is even greater than the jobs supported by many very well known industrial sectors of the economy. For example, air transportation has about 44,000 jobs, broadcasting about 52,000 jobs, and utilities about 61,000 jobs.

When the total value added by CalPERS benefit payments in 2010 is compared to the gross state product the impact on the economy is greater than or equal to the impact of several large NAICS sectors including machinery manufacturing and personal care stores.

Benefit Payments Positively Impact Economy in Every California County

CalPERS annuitants live in all of California's 58 counties. And each county benefits from CalPERS pension payments. Every benefit dollar sent by CalPERS to a resident of a California county increases the economic activity in that county.

In 32 counties benefit payments result in total revenues greater than \$100 million per year. Los Angeles has the greatest total local economic impact from CalPERS payments with \$3,062,343,796 in activity from 2010 payments.

In 39 counties the payments stimulate an increase in the gross county product of more than one percent annually. Sierra County has the highest ratio of pension payments to gross regional product with a 7.74 percent increase resulting from 2010 CalPERS benefit payments.

And in 17 California counties CalPERS 2010 benefit payments supported more than one percent of the jobs in those counties. The greatest ratio of jobs supported to total employment in a county was 1.7 percent in Lassen County with Tuolumne and Amador Counties close behind at 1.6 percent.

The greatest total economic impact occurs in the counties with the largest populations because they have the largest number of CalPERS beneficiaries. The greatest relative economic benefit from CalPERS payments is seen in counties with smaller populations. Whether looking at

job creation or Gross Regional Product (GRP) it is usually the smaller population rural counties along the northern and eastern borders of the state that have the greatest relative positive impact on the economy from CalPERS benefit payments.

The primary exception to this is Sacramento County with a very high proportion of CalPERS annuitants it falls in the top tier in all categories of analysis. Sacramento has the second highest total economic impact after Los Angeles. Yet it is in the top 13 counties with a job creation ratio of 1.1 percent and in the top 19 counties with a ratio of payments to GRP of 2.47%.

Benefit Payments Positively Impact the Nine Regional Economies in California

While CalPERS beneficiaries may live in cities and counties the realities of economic activity are that expenditures are made and have economic impacts over a wider area. This analysis of CalPERS benefit payments in 2010 examines both a statewide impact as well as the impact on California's nine regional economies. The value of a regional analysis is that it captures a more complete picture of how expenditures are really made.

Because only a portion of expenditures made by businesses or people within any jurisdiction are made in that area, a bigger economic unit retains a greater proportion of the expenditures made by those within their jurisdiction. The multiplier effect demonstrates this. The statewide California multiplier for 2010 CalPERS benefit payments is 2.26, or \$2.26 for every CalPERS dollar sent to a beneficiary in California. Smaller units within the state capture smaller portions of the dollars within their jurisdiction and have smaller multipliers.

County multipliers range from 1.28 for Alpine County to 2.01 for Los Angeles County. Larger counties tend to capture some of the expenditures from smaller nearby counties and therefore retain more of the value added from pension payments. The same is true of regions where the largest region – Southern California has a multiplier of 2.02, slightly greater than that of the county of Los Angeles at its heart. The Central Sierra region, which contains Alpine and six other smaller counties,

Pension Payments and Local Revenue Economic Impact Multipliers from CalPERS Pension Payments in 2010

	Pension Payments to California Addresses	Induced Economic Impacts	Total Revenue Economic Impacts	Pension Payments Multiplier
California	\$11,565,547,065	\$14,615,125,354	\$26,180,672,419	2.26
Regions				
Southern California (5 Counties)	\$3,600,981,952	\$3,680,000,000	\$7,280,981,952	2.02
Bay Area (10 Counties)	\$2,499,928,883	\$2,000,882,414	\$4,500,811,297	1.80
Greater Sacramento (6 Counties)	\$2,084,162,175	\$1,910,023,596	\$3,994,185,771	1.92
San Joaquin Valley (8 Counties)	\$1,162,096,399	\$1,107,330,235	\$2,269,426,634	1.95
Southern Border (2 Counties)	\$673,775,704	\$590,748,579	\$1,264,524,283	1.88
Central Coast (4 Counties)	\$539,526,463	\$449,000,000	\$988,526,463	1.83
Northern California (11 Counties)	\$424,365,658	\$326,637,415	\$751,003,073	1.77
Northern Sacramento Valley (5 Counties)	\$373,495,304	\$322,056,327	\$695,551,631	1.86
Central Sierra (7 Counties)	\$207,214,527	\$130,000,000	\$337,214,527	1.63

TABLE 1: Regional Pension Multipliers

has a multiplier of 1.63. But among the other regions there is greater variation with regions like San Joaquin Valley and Northern Sacramento Valley retaining higher portions of their payments than might be expected.

Data and Methodology

The data for this analysis comes from two sources: the California Public Employees' Retirement System (CalPERS) report of retirement benefit payments by California counties in December, 2010 and from the IMPLAN version 3.0 update in August, 2010. Since the 1970s the IMPLAN input-output model has become a standard tool for economic assessment and modeling (visit www.implan.com for more information).

This input-output model uses U.S. Bureau of Labor Statistics data from 2009 as well as other federal data sources. This was the most up to date data available at the time the analysis was initiated and over the years these sources have come to be the standard data sets for calculating economic impact measures for pension funds and other inputs.

This study is a snapshot of the economic "footprint" created by the CalPERS pension benefits paid to California annuitants in 2010. Any expenditure made in a local, regional or national economy has what is usually referred to as a "multiplier effect" on the activity within that economy. That increase in revenue not only provides an immediate boost to the economy as it arrives in the accounts of pension recipients and is spent at local businesses, but over time it generates more local income through a "ripple effect" as secondary and tertiary economic actors then spend the added revenue they have received.

With the increase in revenues businesses then will spend more money in the local economy to increase production, possibly hiring additional workers, and fueling further growth in the local economy. Each round of economic activity generates additional revenue. As funds circulate through the economy jobs are created, incomes, total output and tax revenues expand, and the economy grows even more. An input-output model depicts these economic flows in a regional economy created by a change in payments by any sector within that economy. That data allows us to measure the gross impact on that economy during the period of the original payments.

Researchers and Authors

This study is another in a series of pension fund economic impact studies overseen by Dr. Robert Fountain, Professor Emeritus at California State University, Sacramento. He is the founder of the CSUS Applied Research Institute and the Sacramento Regional Research Institute. He is currently the director of Regional Economic Consultants based in Benicia, CA. He holds a Ph.D. in Urban Land Economics from UCLA and his expertise includes economics, land use, financial planning, modeling, and forecasting.

Dr. Fountain coordinated all of the research and is the principal author of the study. He was assisted in writing and editing the study by Michael W. Perri, the director of the Benefits Research Group at Lincoln Crow Strategic Communications. Perri is a former journalist with policy experience in employee benefits, pensions, health care, water, land use, education, and public finance.

Introduction and Background: California Public Employees' Retirement System

Designed during the tough economic times of the Great Depression to provide a secure retirement for people who dedicated their careers to public service, today the California Public Employees' Retirement System (CalPERS) is the nation's largest public pension fund, managing market assets of more than \$237 billion. Over more than 80 years, millions of California public employees have relied on this retirement system to provide benefits in their post work years and to make sure their families were protected in case of disability or death on the job.

The system was established by the State Employees Retirement Act in 1931 and what was then called the State Employees Retirement System opened its doors in January 1932 providing a retirement plan for only state employees. In 1935 the federal Social Security system was established to assist private sector workers, but leaving out state and local workers. In California the legislature acted to allow county governments to provide retirement systems in 1937 and in 1939 to allow local public agencies and classified school employees to join the statewide system.

Today CalPERS is one of 85 California defined benefit public pension funds established between 1931 and 1951. They are part of a national system of public retirement funds that serves almost 30 million Americans. Together these systems manage funds that provide secure retirements to the families of men and women in public service at every level. But as a recent CalPERS report on the impact of the system's investments makes clear, these pension funds also provide ancillary benefits including the creation of jobs, the expansion of businesses, the development of infrastructure, and the generation of tax revenues through the money they invest and the benefits they pay.

The report released in April, "CalPERS for California 2010: Supporting Economic Opportunity in California," discusses how assets managed by CalPERS are invested in California and analyzes the positive impacts they make on the California economy. While the primary goal of those and the system's other investments around the globe is to achieve appropriate risk adjusted return rates to support benefit payments, the study makes it clear that CalPERS and other institutional investors play an important role in sustaining and growing the economy of California and as well as impacting the economy of other states and regions through their investments.

This current study looks at how CalPERS benefit payments also have significant ancillary benefits to the economy of California. By examining the ripple effect that retiree pension checks have in California communities as people spend their money on goods and services we can begin to measure their economic footprint within the state. What emerges is a snapshot of the gross economic impact of pension payments on employment, gross regional product, tax revenues and total economic activity during 2010.

The more than \$237 billion in assets managed by CalPERS provide retirement benefits to more than 1.6 million state, local public agency, and public school employees, retirees and their families. More than 1.1 million are active employees and more than 500,000 are benefit recipients. Approximately half of those members are also in the Social Security system but more than 50 percent are not covered by the federal system. As a defined benefit retirement plan, CalPERS provides benefits to members based on formulas negotiated by the more than 3,000 employers who participate in the system.

While CalPERS members work and retire throughout the world, approximately 86 percent of CalPERS annuitants live in California and spend their monthly checks in communities in all of the state's 58 counties. This study covers the 431,373 benefit recipients, who lived in California as of December, 2010, and looks closely at the impacts those monthly benefit payments have on the county, regional, and state economies.

CalPERS Members and Retirees at a Glance

What started out as retirement plan for state employees is now a collection of retirement plans for men and women working for more than 3,000 public employers including cities, counties, local agencies and districts, courts, universities, and schools. Approximately 38 percent of CalPERS members are current or former classified school employees. The rest are approximately equally divided between state employees and local agency employees.

At the state level CalPERS members include employees from every department and agency including the California Public Employees' Retirement System as well as the 43,000 who work for the 23-campus California State University System. At the local level CalPERS members work for cities, counties, special districts, and regional agencies throughout the state.

The average CalPERS annuitant retires after 20 years of service at age 60. This study indicates the average monthly California benefit payment is \$2,236 or \$26,811 per year. The typical retiree in fiscal year 2009-2010 worked almost 22 years and retired at age 60 with a monthly benefit payment of about \$3,202. Almost 75 percent of retirees who receive benefits from CalPERS have annual payments of less than \$36,000. Yet taken collectively that amounts to more than \$11.56 billion in California benefit payments in 2010.

Over the last decade an average of more than 23,000 CalPERS members have retired from public service annually. As of December, 2010 there were more than 514,000 retirees, beneficiaries, and retirees receiving monthly checks from CalPERS. Approximately 86 percent of those annuitants live in California and spend their monthly income in the state's 58 counties. This report

documents the economic impact of payments to the 431,373 California residents who received benefit checks from CalPERS in 2010.

Benefit payments to California residents totaled \$11,565,547,065 in 2010. The analysis of CalPERS benefit payments reveals that one consequence of the system's steady performance over the years is an ancillary benefit of growing and sustaining the California economy. The dollars spent by CalPERS retirees have become a significant economic engine in many California communities totaling \$26.181 billion statewide. Those retired public employees and their beneficiaries are approximately 1.2 percent of the population of California yet the total economic activity from their benefits was almost 1.4 percent of the Gross State Product in 2010.

CalPERS: A Defined Benefit Plan

While CalPERS also administers health benefits as well as supplemental savings plans for some agencies, this study focuses on its role as a defined benefit pension plan that pays out benefits to members based on 13 different retirement formulas that are established through contract negotiations between 3,033 public employers and their employees. Based on the contract provisions and the agreements between employers and CalPERS, contributions are then invested through risk pools and in non pooled retirement plans.

Defined benefit pensions are a shared responsibility among the employer and employee participants and the funds established to manage the retirement system investments. CalPERS is a prefunded system which means that the retirement system receives regular contributions from both employees and employers for each worker during the course of that worker's career.

Contributions from employers and employees are invested and compounded over time. The total pool of resources is then used to pay benefits to the plan participants. CalPERS pays out nearly \$12 billion in pension benefits each year to retirees and beneficiaries using investment income and cash contributions from employers and members. Investment assets are not sold to generate cash.

CalPERS has a long history of solid, risk-adjusted returns, recording gains in 21 of the last 25 years. In 17 of those years the returns were greater than 10 percent. Over the past 20 years, CalPERS has earned an average annual investment return of 7.9 percent. From 1988 to 2010, CalPERS has generated an annual average return of 8.6 percent. The fund continues to grow, earning more than \$70 billion since the financial crisis in 2008. CalPERS recently reported a 12.5 percent return on investments for the one -year period ended December 31, 2010, well above its 7.75 percent assumed rate of return needed to pay long-term pensions.

When you analyze the historical earnings from CalPERS investments the specific components of the shared responsibilities of a defined benefit plan becomes quantifiable. For every pension dollar paid over the last 20 years, 64 cents comes from investments, 21 cents from employers, and 15 cents from members. Over time earnings on investments have made up the major share of CalPERS pension fund payments to beneficiaries.

Further analysis of the impact of these percentages allows us to calculate a return on investment of the contributions made by employers to the pension benefits paid to California residents. Because 21 percent of every dollar paid out to beneficiaries is an employer contribution that means that of the \$11.566 in total benefits paid, \$2.429 billion came from employers. When you divide the total local economic activity resulting from the benefit payments in 2010 – \$26.181 billion – by the amount attributable to public employers, the return on that investment to California communities is \$10.79 for every dollar contributed.

Summary of Statewide Economic Impacts

California

Economic Description

<i>Population</i>	36,961,660
<i>Employment</i>	19,856,985
<i>Gross Regional Product</i>	\$1,874,562,183,938
<i>Labor Income</i>	\$998,029,585,549

CalPERS Beneficiaries

<i>Number of Recipients</i>	431,373
<i>Retirement Benefits</i>	\$11,565,547,065
<i>Annual Average Benefits</i>	\$26,811

Total Local Economic Activity

<i>Direct CalPERS Retirement Payments</i>	\$26,180,672,419
<i>Induced Business Revenues</i>	\$11,565,547,065
	\$14,615,125,354

Components of Economic Impacts

<i>Increase in Gross Regional Product</i>	\$8,635,420,824
<i>Employment</i>	93,651
<i>Labor Income</i>	\$4,794,771,073
<i>Increase in Sales taxes</i>	\$291,217,280
<i>Increase in Property taxes</i>	\$328,751,783

Local Industry Sectors with Largest Economic Benefits

Description	Employment	Revenues
Food services and drinking places	10,165	\$666,186,990
Real estate establishments	5,460	\$1,007,768,303
Offices of physicians, dentists, other health	5,063	\$674,246,217
Private hospitals	4,092	\$688,871,686
Wholesale trade businesses	3,777	\$769,700,695
Retail Stores - Food and beverage	2,420	\$177,792,300
Nursing and residential care facilities	2,345	\$150,802,003
Retail Stores - General merchandise	2,258	\$136,486,176
Securities, commodity contracts, investments	2,252	\$208,026,674
Individual and family services	1,741	\$68,432,933

This data is for CalPERS 2010 California beneficiaries only.

TABLE 2: California Summary

Summary of Key Findings

This study assesses the impact of expenditures made by retirees from their CalPERS pensions along four primary dimensions – Employment, Total Local Economic Activity (total impacts or total output), Increase in Gross Regional Product (value added), and Tax Impacts. The analysis has been run at a statewide level, at the level of each county in California and at the level of nine California economic regions as defined by the California Economic Strategy Panel in 2006.

Using the IMPLAN input output model this study analyzes the impact of 2010 CalPERS pension payments to 431,373 California resident beneficiaries. Using the IMPLAN model of the county or regional economy shows the full effects of benefit payment on all sectors of the economy, not just the CalPERS benefit recipients. When the CalPERS annuitants receive their benefits payments, that infusion of income into the local economy creates a chain of economic activities whose total is greater than the initial benefits payments.

Our analysis finds that CalPERS pension benefit payments have a significant economic footprint in California and in all of its counties and regions. Even though California annuitants make up about 1.2 percent of the state population, their economic clout accounts for 1.4 percent of the Gross State Product (GSP) in 2010. Across the four dimensions of analysis in this study the \$11,565,547,065 in direct CalPERS retirements made to California residents in 2010 added to economic activity in the state.

Employment – Benefit Payments Support 93,651 California Jobs

When retirees spend their pension checks they support businesses and create jobs. Statewide in 2010 CalPERS beneficiaries supported 93,651 California jobs. Those jobs were supported across the state in every county. The impact is greater in larger counties with more population and more diverse economies, but

even in the smallest population areas every time a retiree goes to a restaurant or a store or to see a healthcare provider they stimulate additional economic activity with their purchases.

When benefit recipients spend on household consumption (such as utilities, groceries, retail purchases, housing payments, education, health care, transportation, local taxes, and many other categories) the business or government providers of those goods and services receive additional sales or revenues. This increases the provider's profits, employee compensation, and supports additional workers who would not be supported without the CalPERS benefit payments.

In California the number of jobs supported by CalPERS retirees' expenditures is greater than the jobs supported by many industrial sectors of the economy as classified by the North American Industry Classification System (NAICS). For example, air transportation has about 44,000 jobs, broadcasting about 52,000 jobs, and utilities about 61,000 jobs. Taken together three sectors – livestock production, with about 35,000 jobs, internet publishing, with about 34,000 jobs, and paper manufacturing, with about 22,000 jobs – support less employment than CalPERS pension payments. The two closest sectors in impact to CalPERS benefit payments are courier and messenger services which have about 93,000 jobs and rental and leasing services which has about 94,000. (See Tables)

To put those numbers in some context during a period of high unemployment following the 2007 recession, between December 2009 and December 2010 California added 82,600 nonfarm jobs for a gain of 0.6 percent, according to a Center for the Continuing Study of the California Economy report in March 2011.

In 2010 the jobs supported by CalPERS benefit payments resulted in almost \$4.794 billion in labor income across the state. That income is then spent by those

who receive it and the cycle of economic activity continues with additional indirect and induced impacts on the economy. At each level of analysis the tables that follow delineate the impact on employment at the county as well as the regional levels.

This study also looks at the top ten industrial sectors in each jurisdiction based on the total jobs supported and revenues created by each sector as classified by the NAICS. At a statewide level the list of industries supported by these payments includes food services, real estate, doctors and hospitals, retail stores, and family services. The analysis at the county and regional level reveal some variation among jurisdictions, but for CalPERS beneficiaries a large part of expenditures are made on household consumption, health care and other services.

The “Ten Largest Industry Sectors” tables for each county and region are made up primarily of industries that reflect these household expenditures. The differences between counties are partly due to variations in how much of the consumer demand is met locally within the county or is lost to nearby counties which may have a larger retail outlet or a major regional hospital. The regional patterns are more similar across all regions. The data sheets for each individual county and region within the state are compiled in the appendix.

Total Local Economic Activity – Benefit Payments Foster \$26.181 Billion in 2010

The total local economic activity caused by a specific economic action or input includes the value of all goods and services either directly supported or induced by those dollars. The IMPLAN analysis indicates that \$26,180,672,419 was contributed to the state economy in 2010 as a direct and induced consequence of retiree spending. That figure represents almost 1.4 percent of the Gross State Product (GSP) of \$1,874,562,183,938 in that year.

Direct statewide impacts from retiree payments totaled \$11.566 billion in 2010. When those beneficiaries spend their incomes on household consumption it generates a second round of incomes to businesses and suppliers. That secondary round of expenditures in turn creates a

third round of expenditures, and the linked sequence of expenditures will continue until successive rounds become infinitesimally small, at which time the sum of all the successive rounds of benefits will be much higher than the original CalPERS benefit payments. These are called induced impacts or induced business revenues.

In 2010 CalPERS retiree payments created \$14,615,125,354 in induced business revenues. Taken together the direct retiree benefit payments and the induced business revenues add up to the total local economic activity created by the pension benefits paid to California annuitants. The ratio of the total economic activity divided by the direct retiree benefit payments is usually referred to as the economic multiplier. Depending upon the direct impact sector and the specific attributes of the local economy under study, the multiplier usually ranges between 1.0 and 3.0.

Statewide the CalPERS multiplier is 2.26, which means that every dollar sent to a CalPERS beneficiary living in California in 2010 generated \$2.26 worth of economic activity. An examination of the regional impacts of California benefits indicates that usually the larger the geographic and economic entity under analysis, the larger the multiplier. Because more economic events are captured in the larger jurisdiction the secondary and tertiary induced business revenues are greater, usually resulting in greater local economic activity. The multiplier is primarily determined by those differences in the scope and structure of the local economy but the amount of the CalPERS retirement payments also has an impact.

Like CalPERS, other state institutions have worked over the years to assess their impact on the local and state economies. Prominent among these are studies by the University of California System and many of its member institutions. In recent years three fast growing universities have released data documenting the significant impact of the University of California on the economy through jobs and spending that support local businesses and the community.

The latest system-wide report from UC is for 2002 but the more recent reports from the University of California San Francisco (\$6.2 billion total economic activity), University of California San Diego (\$4.7 billion) and University of

California Irvine (\$4.2 billion) indicate that these institutions continue to contribute. Because these institutions have large numbers of employees the model includes direct payments, indirect payments and induced payments in the calculations which further increase their impact.

Increase in Gross Regional Product – Benefit Payments Add \$8.635 Billion to GSP

The CalPERS retirement payments and ripple effects stimulated economies throughout California and increased the Gross Regional Product (GRP) in every county and resulted in a statewide increase in GSP by \$8.635 billion in 2010. This is value added or new dollars generated in the economy. That amounts to almost a half of a percent increase in California's \$1.875 trillion economy.

If you compare CalPERS' impact on the GSP to industrial sectors of the state economy as classified by NAICS, many well known industrial sectors have less of an impact on the state economy than the total resulting from CalPERS benefits. The broadcasting (\$6,878,990,848 value added), oil and gas extraction (\$6,449,836,032), air transportation (\$5,380,235,776), and many other sectors of the California economy had far lower impact in 2009, which is the latest year with available data.

CalPERS' pension payments in 2010 had greater value added impact to the state economy than the total of furniture production (\$2,871,073,280), rail transportation (\$1,809,955,968), livestock production (\$1,609,895,552), museums (\$1,063,653,312), and mining (\$1,031,548,352). Each of those industries contributes significantly to the growth of the economy, creating jobs and increasing the amount of money that is earned every year by Californians. But the payments to CalPERS retirees resulted in greater growth in GSP in 2010.

The industries most comparable to the economic impact created by CalPERS retirees' expenditures include machine manufacturing which is just above the benefit payments on the NAICS list with a \$9,107,678,208 increase in GSP and health and personal care stores just below pension payments which increased GSP by \$8,626,411,520.

The increase in GSP generates a significant impact on jobs as discussed above. Those jobs resulted in almost \$4.8 billion in labor income for California residents in 2010. This figure includes not only employee compensation such as salaries and wages but also what is known as proprietors' income which includes payments to consultants and self-employed individuals or sole proprietors. This is a far more robust measure of the impact on earnings than available through previous IMPLAN models.

Tax Impacts – Benefit Payments Add \$1,041,200,253 in State and Local Taxes

The economic activities stimulated by CalPERS retirement payments resulted in the generation of \$1,041,200,253 in state and local taxes from all sources during 2010.

Previous versions of the input-output model amalgamated most taxes and did not allow an effective analysis of the tax impact of economic activity at the local level. The latest IMPLAN update has refined the analysis of tax revenues and allows for the differentiation between revenues resulting from sales taxes and from property taxes.

Most taxes and fees are collected at the state level and cannot be attributed to local economic activity. The new model calculates the impacts from the payment of CalPERS retirement benefits on property and sales taxes at the county and regional level and those figures are included in the summary pages as well as the composite data base.

The economic activities stimulated by CalPERS retirement payments resulted in the generation of \$619,969,063 in property and sales taxes at the local level in California counties during 2010. CalPERS benefit payments in 2010 increased sales tax collections in 2010 by \$291,217,280 and property tax revenues by \$328,751,783.

State and Local Taxes Generated by the 2010 CalPERS Retiree Benefit Payments

Taxes on Businesses and Corporations	\$877,340,513
Dividends	\$100,638,160
Corporate Profits Tax	\$50,036,808
Sales Tax	\$291,217,280
Property Tax	\$326,371,552
Motor Vehicle Lic	\$6,682,028
Severance Tax	\$112,201
Other Taxes	\$57,281,648
Other State & Local Fees	\$30,698,204
Social Ins Tax- Employer Contribution	\$14,302,632
Taxes on Households and Employees	\$163,859,740
Income Tax	\$114,856,416
Fines & - Fees	\$34,396,816
Motor Vehicle License	\$5,359,192
Property Taxes	\$2,380,231
Other Tax (Fish/Hunt)	\$1,108,882
Social Ins Tax- Employee Contribution	\$5,758,203
Total State & Local Taxes	\$1,041,200,253
Total CalPERS Retiree Benefits Paid	\$11,565,547,065
State & Local Tax Revenues Generated as Percent of Benefits Paid	9.00%

TABLE 6: County Key Economic Findings

Statewide Economic Impacts

The California economy is the eighth largest in the world when compared with countries around the globe. The United States is the largest of the national economies, followed by China and Japan. Over the years, if individual US states are compared to nations, California has been close in size to Brazil, Italy, Spain, and Canada.

Within the United States, California as the largest state economy accounts for more than 13 percent of the Gross Domestic Product (GDP) of the country. The next biggest states after California in terms of Gross State Product (GSP) are Texas and New York, both at about \$1.15 trillion.

With a population close to 37 million people and almost 19 million jobs, California generates more than \$1.875 trillion in annual economic activity. In 2010

more than \$998 billion of that economic activity was paid as income to the men and women in those jobs.

NAICS uses 20 primary industrial sectors to classify the statewide contributions of businesses to the GSP for California. The largest sector of the state economy in 2010 was real estate and leasing with more than \$274 billion in value added to the economy, accounting for 14.6 percent of the GSP. CalPERS retiree payments with a greater than \$26 billion contribution to GSP was larger than four of these 20 sectors including management, agriculture and forestry, educational services, and mining. These primary classifications are then further subdivided by NAICS to allow greater specificity of analyses.

TABLE 7: Major NAICS Classifications

Statewide Overview of the Economic Impacts of CalPERS Retirement Benefits Payment in 2010

Direct CalPERS Benefits Payments	\$11,565,547,065
Plus Induced Business Revenues	\$14,615,125,354
Equals Total Economic Revenues	\$26,180,672,419
Which includes an Increase in Gross State Product (Value Added) of	\$8,635,420,824
And Supports Full-time Equivalent Employment of	93,651
With Labor Income of	\$4,794,771,073
And State and Local Taxes of	\$1,041,200,253

TABLE 8: Statewide Summary

Benefit payments to CalPERS California annuitants totaled \$11,565,547,065 in 2010. Those dollars paid to residents of every California county have a significant impact on the state economy. The total payment amounted to 0.62 percent of the statewide economic output last year. That means that out of every 161 things and events that occur in the California economy – jobs, products, transactions, benefits, consequences – at least one of them is a direct or indirect result of the money sent every month to California retirees.

Statewide the 2010 CalPERS benefit payments stimulated more than \$26 billion in total economic activity in California, almost 1.4 percent of the statewide economic activity. That economic activity increased the gross regional product (also known as the Gross State Product or GSP) by more than \$8.6 billion in 2010. The net result is that CalPERS benefit payments increased the 2010 GSP by 0.46 percent. And all that economic activity supported 93,651 California jobs during a tough year for employment in the state.

The increase in total economic activity is a result of the economic multiplier effect. When dollars are spent in a community each direct expenditure results in indirect and induced impacts, which then cause those dollars to stimulate further economic activity. The multiplier is the ratio of total economic impacts on the economy to the direct CalPERS payments. In this case, \$11,565,547,065 in pension payments to California beneficiaries results in \$26,180,672,419 in total economic activity. Statewide every dollar paid to a CalPERS beneficiary results in \$2.26 in economic activity for a multiplier of 2.26.

The multiplier is determined by the amount of the expenditures which are retained in the economy. Since some households in every political or geographic region spend some of their income outside the home region, the statewide multiplier is larger than any local multiplier because it captures all of the inter-regional expenditures.

Comparing Retiree Employment Support with NAICS Industrial Subgroups

If you look at the job creating impact of the CalPERS benefit payments in 2010 it is comparable to many of the secondary business sectors grouped by NAICS according to type of economic activity. NAICS breaks down the 20 primary classifications into more specific subgroups that reflect unique sectors. CalPERS' benefits supported more than 93,000 of California's jobs in 2010, comparable to many classifications counted by NAICS in the previous year including publishing, chemical manufacturing and warehousing.

NAICS Industry Sectors	Employment
Publishing industries	104,726
Miscellaneous mfg	95,479
Credit, mediation & related	95,181
Rental & leasing services	94,086
CalPERS Economic Benefits	93,651
Couriers & messengers	92,647
Sports-hobby-book & music stores	92,222
Sightseeing transportation	88,884
Chemical Manufacturing	75,634
Warehousing & storage	73,159

TABLE 9: Job Creation

And when you compare the total value added by CalPERS benefit payments in 2010 of \$8.365 billion to the gross state product the impact to the economy is greater than or equal to several large NAICS sectors including machinery manufacturing and personal care stores.

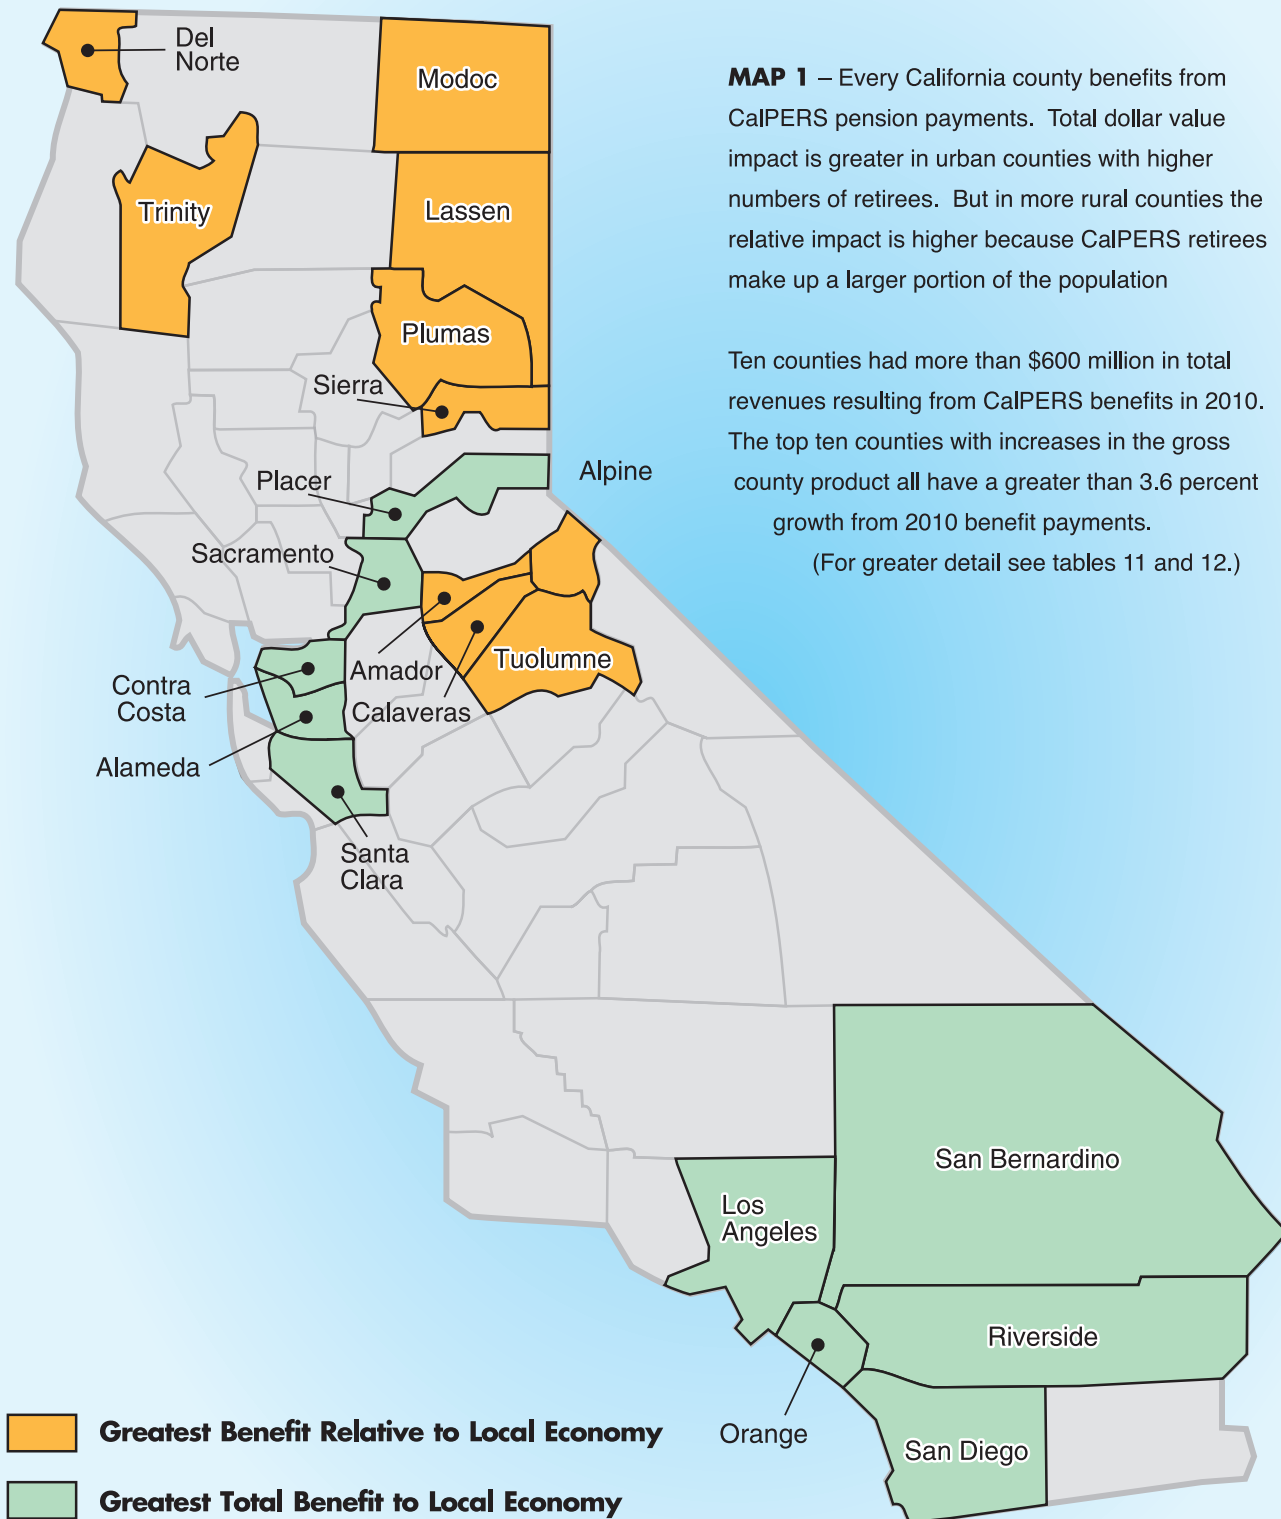

NAICS Industry Sectors	Impact on GSP
Nursing & residential care	\$10,062,779,392
Rental & leasing services	\$10,050,094,080
Machinery Manufacturing	\$9,107,678,208
CalPERS Economic Benefits	\$8,635,420,824
Health & personal care stores	\$8,626,411,520
Funds - trusts and other finance	\$8,317,788,160
Building materials and garden dealers	\$8,034,758,144
Broadcasting	\$6,878,990,848
Sightseeing transportation	\$6,844,665,856
Gasoline stations	\$6,821,902,848

TABLE 10: Increases in GSP

What Industry Sectors Do Retiree Benefits Support?

The IMPLAN model analyzes which of these NAICS business sectors are influenced by the economic impacts under study. Statewide the sectors of the economy that saw the most stimulation from the CalPERS pension payments in 2010 included food services, real estate, and health care – all with more than 5,000 jobs supported by retirees. The greatest single revenue impact from retiree expenditures last year was more than \$1 billion to real estate, the largest sector of the state economy. The impact on employment and revenues generated in the ten industrial sectors with the largest economic benefits are listed in the statewide and other summary tables.

Economic Impact is Significant in Every California County

A CLOSER LOOK AT County by County Economic Impacts

California retirees live in every county. And economic activity increases in every California county because CalPERS sends monthly pension payments to retired public employees and their families. Comparing the impact of pension payments across the state's 58 counties there is great variation due to both the number of benefit recipients in each county and the structure of the local economies.

For largely urban counties with larger numbers of retirees, like Los Angeles and Sacramento, the total economic impact is in the billions of dollars every year. But comparative analysis of pension payments in California counties in 2010 also indicates that even in rural Alpine County with only 63 CalPERS beneficiaries the payments add more than 3.7 percent to the Gross Regional Product (GRP) in 2010.

Larger Counties Have Greatest Total Benefit to Local Economy

Counties with the largest number of CalPERS retirees get the largest infusions of cash into their economies. The total CalPERS payments to the 62,533 CalPERS beneficiaries in Los Angeles is more than \$1.5 billion and to 43,119 CalPERS retirees in Sacramento is more than \$1.3 billion annually. In Los Angeles those pension payments generated more than \$3 billion in total economic activity in 2010 and in Sacramento the total was almost \$2.5 billion.

Distributed throughout California's 58 counties the more than \$11.5 billion in 2010 CalPERS pension payments are significant even before the money circulates through the economy creating the multiplier effect. In half of California counties 2010 benefit payments result in total revenues greater than \$100 million annually. There are 19 counties with payments greater than \$200 million and eight counties with payments greater than \$500 million per year.

Those payments ripple through the economy creating additional economic activity depending on the structure and size of the local economy. Out of the 19 counties that received more than \$200 million in CalPERS payments last year, 10 of them generated total annual economic activity of more than \$600 million and the other nine all generated more than \$317 million

Smaller Counties Have Greatest Relative Economic Benefit to Local Economy

The other half of California's counties received less than \$100 million in benefit payments in 2010, but even in those counties, where the absolute dollars received is significantly lower, the impact is great. For smaller, more rural counties the retiree expenditures add a strong proportional boost to the local economy with some seeing a greater than five percent increase in the GRP as a result of spending by CalPERS retirees.

The ratio of CalPERS payments to GRP (the total net earnings of the County economy) is highly negatively related to county population. Nearly all of the smaller counties are at the top of the rankings for Pension Payments/GRP ratio, while nearly all of the largest counties have very small ratios. The ratios range from a low of 0.12 percent for San Francisco to a high of 7.74 percent for Sierra County, a range of nearly 65 to 1.

The top ten counties – Sierra, Trinity, Calaveras, Amador, Lassen, Del Norte, Tuolumne, Modoc, Alpine, and Plumas — all have a greater than 3.6 percent impact on GRP from the payments to CalPERS annuitants. All in all the CalPERS pension payments stimulate GRP by more than one percent annually in 39 counties, most of them with smaller populations. Aberrations include Sacramento, a relatively large county with a relatively large ratio of CalPERS payments to GRP, and at the other end of the spectrum, Madera and Imperial Counties which are small but have low ratios.

TABLE 12: Total Revenues

County Multipliers

The total effect on a county created by CalPERS retirement benefit payments is not just the payments to retiree households, but includes also the induced effects on local business and governments created when the retirees spend that income. The expenditures include all of the components of household consumption, including housing, transportation, health care, groceries, entertainment, local taxes, and all other household items and services.

These expenditures then generate additional economic revenues through the revenues and expenditures of the local firms which supply these goods and services, including their employees and purchases from other local firms and local government. The additional revenue generation is computed using the IMPLAN econometric model which is calibrated on the existing economic structure of each county.

The total revenues, including both the direct CalPERS payments and the induced local economic activities, are significantly larger than the direct retirement payments. As a result, there is a “multiplier effect” which is the total revenues divided by the CalPERS retirement payments. The value of the multiplier is determined by the ability of the local economy to supply the goods and services required for the household and business purchases. Larger counties with a fully diversified business sectors have large multipliers because they keep most of the expenditures within the county. Smaller counties in which retirees have to travel outside the county to find what they need, lose some of the induced impacts and have smaller multipliers.

The multipliers for the California counties are shown in the table above. The largest multiplier of 2.01 occurs in Los Angeles County, and most of the large counties also have large multipliers. Smaller counties like Alpine, Sierra, and Modoc have lower economic levels of economic ripples, with multipliers around 1.3.

There are some interesting exceptions, such as San Joaquin and Stanislaus, which have high multipliers despite being relatively smaller counties. This indicates that they have more complete economic structures than would be expected based on their population rank, probably because they supply goods and services to a large expanse of San Joaquin Valley farming counties with limited household services. By contrast, Santa Clara and Contra Costa are larger counties which have relatively small multipliers, indicating incomplete household services sectors, probably as a result of proximity to San Francisco and Alameda Counties, which have more extensive retail sectors.

resulting from CalPERS retirement benefits 17 counties have more than one percent of their total employment supported by these payments.

The analysis reveals that CalPERS’ retirement benefits support a significant percentage of the employment of many of California’s smallest Counties. Most of the State’s counties with the highest population ranks are among the lowest in percentage of employment resulting from CalPERS pensions while many of the Counties with lower population rankings have a high percentage of employment dependent on CalPERS pension payments.

The 17 most significant employment impacts are not completely congruent with the highest GRP ratio counties, but there is some overlap. Looking at just the top ten in each ratio list three counties are different with Shasta, El Dorado, and Siskiyou counties joining the employment top ten and Modoc, Alpine, and Plumas dropping off.

The ratios of CalPERS employment impacts to total employment range from a low of 0.10% for San Francisco County to 1.7% for Lassen County, a ratio of about 17 to 1.

There are some aberrations in the distribution. Alpine and Modoc Counties are very small but have a relatively small percentage of employment supported by CalPERS retirement benefits, while Sacramento County, with a relatively large population, also has a relatively large percentage of employment related to CalPERS retirement benefits.

County Employment Impacts

Due to the wide variation in population among California counties as well as the variations in CalPERS benefit payments resulting from the magnitude of the retiree population, it is helpful to look at employment impacts at the county level through another ratio. By examining the relationship between total employment in the county and the employment attributable to the economic activity

Ratio of CalPERS Employment Impacts to Total Employment

TABLE 14: Number of Beneficiaries

The Nine Regional Economies of California

MAP 2 – Economic data is collected at the county level but economic activity operates across jurisdictional boundaries. We have adopted the alignment proposed by the California Economic Strategy Panel in October 2006. The economic impact across a region is greater than the impact within any individual county.

Regional Economic Impacts

Most economic data is collected at the county level but economic activity is not determined by jurisdictional boundaries. To facilitate analysis and planning, over the years diverse agencies have developed a wide variety of possible regional groupings for California counties. For this study we have adopted the alignment proposed by the California Economic Strategy Panel in October 2006. Those and similar alignments are utilized by planners and forecasters to develop regional economic strategies.

In this study we have modeled the impact of CalPERS benefit payments to annuitants in each of these regional economies. Not surprisingly the regions with the largest populations and most diverse economies as well as those with the greatest numbers of CalPERS retirees had the greatest economic benefit from pension expenditures. The five county Southern California Region (pale green on the map) with more than 140,000 retirees garnered more than 31 percent of the pension payments in 2010. And because the economy is so comprehensive and diverse the pension multiplier there was the largest of any region at 2.02.

The multiplier is determined by the amount of the expenditures which are retained in the economy. Since some households in every region spend some of their

income outside the home region, the regional multipliers are smaller than the statewide multiplier, which captures all of the inter-regional expenditures. Regions with high multipliers are capturing some of the expenditures resulting from the expenditures by CalPERS recipients in adjacent regions, while regions with low multipliers are losing some of their revenues to adjacent regions. It is generally the case that the largest regions in terms of population and employment capture some of the expenditures from smaller adjacent regions.

But when you analyze the regional data in other ways it reveals that impacts relative to the local economy are far greater in the smaller and more rural counties even though they lose some of their impact to neighboring regions through the bleeding of the multiplier effect across borders. Two key measures underscore this dynamic impact on smaller regional economies. If you analyze the increase in gross regional product resulting from CalPERS pension payments in relation to the total gross regional product it is clear that most rural regions get a bigger percentage boost from the retirees than more populous areas. A similar pattern emerges when you look at employment created by the payments against total regional employment.

Pension Payments and Local Revenue Economic Impact Multipliers from CalPERS Pension Payments in 2010

	Pension Payments to California Addresses	Induced Economic Impacts	Total Revenue Economic Impacts	Pension Payments Multiplier
California	\$11,565,547,065	\$14,615,125,354	\$26,180,672,419	2.26
Regions				
Southern California (5 Counties)	\$3,600,981,952	\$3,680,000,000	\$7,280,981,952	2.02
Bay Area (10 Counties)	\$2,499,928,883	\$2,000,882,414	\$4,500,811,297	1.80
Greater Sacramento (6 Counties)	\$2,084,162,175	\$1,910,023,596	\$3,994,185,771	1.92
San Joaquin Valley (8 Counties)	\$1,162,096,399	\$1,107,330,235	\$2,269,426,634	1.95
Southern Border (2 Counties)	\$673,775,704	\$590,748,579	\$1,264,524,283	1.88
Central Coast (4 Counties)	\$539,526,463	\$449,000,000	\$988,526,463	1.83
Northern California (11 Counties)	\$424,365,658	\$326,637,415	\$751,003,073	1.77
Northern Sacramento Valley (5 Counties)	\$373,495,304	\$322,056,327	\$695,551,631	1.86
Central Sierra (7 Counties)	\$207,214,527	\$130,000,000	\$337,214,527	1.63

TABLE 15: Regional Summary

In both cases it is the Central Sierra Region (goldenrod color on the map) consisting of Amador, Alpine, Calaveras, Inyo, Mariposa, Mono, and Tuolumne counties that has the greatest percentage impact, more than tripling the statewide figure with a 1.46 percent increase in gross regional product and almost the same

level with a 1.36 percent increase in employment. Both the 11 county Northern California Region (yellow on the map) and the Northern Sacramento Valley Region (light blue on the map) are close behind in percentage increases.

Percent of State Region Gross Regional Product Resulting from CalPERS Pension Payments

	Gross State or Regional Product	Increase to GRP Resulting from CalPERS Pension Payments	Percent GRP Change
California	\$1,874,562,183,938	\$8,635,420,824	0.46%
Regions			
Central Sierra (7 Counties)	\$5,400,947,942	\$78,625,749	1.46%
Northern California (11 Counties)	\$15,049,002,632	\$195,350,447	1.30%
Northern Sacramento Valley (5 Counties)	\$15,143,176,066	\$194,358,351	1.28%
Greater Sacramento (6 Counties)	\$101,368,108,573	\$1,196,594,876	1.18%
Central Coast (4 Counties)	\$49,786,239,909	\$275,401,199	0.55%
San Joaquin Valley (8 Counties)	\$119,422,826,553	\$645,202,825	0.54%
Southern California (5 Counties)	\$867,301,000,000	\$2,195,234,027	0.25%
Bay Area (10 Counties)	\$523,050,667,724	\$1,233,934,824	0.24%
Southern Border (2 Counties)	\$178,039,983,298	\$366,086,836	0.21%

TABLE 16: Increase in GRP

The one more populous region that does not fit this pattern is the six county Greater Sacramento Region (turquoise on the map) which is the only other region with greater than one percent impact in both areas.

Despite its larger economy this region has a very high proportion of CalPERS retirees within its jurisdiction which likely accounts for this higher percentage impact on the economy.

Employment Impacts Generated by CalPERS Pension Payments in 2010

	Total Employment	Employment Created by CalPERS Pension Payments	Ratio of CalPERS Employment Impacts to Total Employment
California	19,856,985	93,651	0.47%
Regions			
Central Sierra (7 Counties)	79,502	1,081	1.36%
Northern California (11 Counties)	228,767	2,873	1.26%
Northern Sacramento Valley (5 Counties)	222,332	2,771	1.25%
Greater Sacramento (6 Counties)	1,210,385	14,361	1.19%
Central Coast (4 Counties)	632,021	3,448	0.55%

Footnotes for Summary Tables

1. Source: Economic data from the US Bureau of Labor Quarterly Census of Employment and Wages (QCEW) data embedded in the IMPLAN model. Population data from the US Census Bureau. Data may differ from other sources due to varying definitions of the types of population and employment included.
2. Gross Regional Product is the sum of the value added in all industry sectors and includes profits, proprietors' compensation, employee compensation, and depletion of capital assets.
3. Source: California Public Employees' Retirement System, December 2010
4. Estimated using the IMPLAN model calibrated on the latest QCEW data (2009).
5. Induced revenues occur in local businesses when CalPERS pension recipients make household purchases including housing, groceries, transportation, taxes, entertainment, other retail, and all other household consumption items.
6. Sales and property taxes are computed by the IMPLAN model based on actual business and household payments, and measure generation, not distribution. The actual distribution between State and Local governments depend on complex allocation rules which are rapidly changing and are not computed in this analysis.
7. Computed IMPLAN outputs based on local induced business revenues resulting from CalPERS payments, truncated to the 10 largest for brevity.

Background on Economic Impact Studies

Pension Impact Studies:

You can find these and other pension fund economic impact studies on the National Association of State Retirement Administrators website at: <http://www.nasra.org/resources/economic.htm>.

Measuring the Impact of CalPERS Pension Benefits in California

This study is a snapshot of the economic “footprint” created by the CalPERS pension benefits paid to California annuitants in 2010. Any expenditure made in a local, regional or national economy has what is usually referred to a “multiplier effect” on the activity within that economy. That increase in revenue not only provides an immediate boost to the economy as it arrives in the accounts of pension recipients and is spent at local businesses, but over time it generates more local income as secondary and tertiary economic participants then spend the added revenue they have received.

With the increase in revenues businesses will then spend more money in the local economy to increase production, possibly hiring additional workers, and fueling further growth in the local economy. Each round of economic activity generates additional revenue. As funds circulate through the economy jobs are created, incomes, total output and tax revenues expand, and the economy grows even more.

An input-output model depicts these economic flows in a regional economy created by a change in payments by any sector within that economy. That data allows us to measure the gross impact on that economy during the period of the original payments. The IMPLAN model used in this study uses the benefit data payments to CalPERS beneficiaries as a starting point. Those payments are the expenditures that have a direct impact on the regional economy.

Based on those direct impacts from CalPERS benefit payments the IMPLAN model then calculates:

- The indirect impacts of those firms that do business with the industry making the direct impact.
- The induced impacts of individual employee (or in this case benefit recipients) expenditures.

Because CalPERS retirement payments are made directly to households and not to businesses, only the direct and induced measures of impact are relevant to this study. For this study we have given the components of our analysis names that are more readily understandable by those not familiar with input output modeling. The IMPLAN names are in ***bold italic*** on the glossary below, followed by the CalPERS study name in parenthesis in **bold**.

Direct Impacts (Retirement Payments) (also referred to as Direct CalPERS Retirement Payments) are the expenditures by an industry, or in this case CalPERS, which creates the economic impacts. Impacts can include construction, maintenance and repairs, operating expenses, and all other activities conducted as part of the event under analysis.

Indirect Impacts (Not applicable to pension payments) are the expenditure and employment impacts of firms which sell goods and services to the direct industry being studied. Examples include supplying materials, products, utilities, professional services such as legal, accounting, and advertising; utilities and government services; transportation; and other inputs. Since the payments by CalPERS are made to individuals these types of transactions undertaken by annuitants are calculated as induced impacts.

Induced Impacts (Induced Business Revenues) are created when the employees of the direct and indirect industries spend their wages for household consumption including housing, transportation, groceries, retail expenditures, education, and all other household consumption. As can be seen from the statewide summary, for CalPERS beneficiaries a large part of the expenditures are made for health care and other services.

Appendix

For that reason, the "Ten Largest Industry Sectors" tables for each County are made up primarily of household consumption expenditures rather than inter-business transactions. The differences between Counties are partly due to variations in how much of the consumer demand is met locally within the county, or is lost to nearby counties which have a larger retail outlet or a major regional hospital.

Total Impacts (Total Local Economic Activity) are the sum of all the above, and are larger than any of the above components, resulting in the economic multiplier which shows the ratio of total impacts to direct impacts. Also known as the Total Revenues or Total Output, this measure is the total economic flow generated by the event under analysis, no matter who makes or receives the expenditures.

Value Added (Increase in Gross Regional Product) payments are the revenues of each business or government entity less what it purchases from others (through indirect payments) to create the revenues. This is made up of payments to business owners and proprietors, payments to or on behalf of employees, and payments to fixed resources such as property rents or ownership costs. The sum of value added payments throughout all sectors of a regional economy is the Gross Regional Product.

Employment Compensation (Labor Incomes) is a more robust measure than in previous models accounting for a total about 15% higher than other models because it includes compensation to the self-employed, consultants, and others who do not work directly for reporting businesses. This figure includes the total payment to or on behalf of employees, and includes not only wages and salaries but also benefits and taxes paid on behalf of employees.

Employment measures annual full time equivalent positions, and can differ from an employee count because multiple temporary or part time workers add up to a lesser number of full time equivalents.

Sales taxes are computed from the actual indirect taxes paid by businesses. The distribution of the sales taxes to state, county, city, and special districts or measures is not provided in this analysis as it requires a detailed fiscal and accounting analysis and changes frequently due to state and local realignment of revenues.

Property taxes include not only those generated by the project under analysis, but also include the effects of expanding business and household expenditures for real property resources.

Data and Methodology

The data for this analysis comes from two sources: the California Public Employees' Retirement System (CalPERS) report of retirement benefit payments by California counties in December, 2010 and from the IMPLAN version 3.0 update on August 27, 2010. This input-output model uses U.S. Bureau of Labor Statistics data from 2009 as well as other federal data sources. The modeling was run in February and March 2011. This data was the most up to date data available at the time the analysis was initiated. Over the last decade these sources have come to be the standard data sets for calculating economic impact measures for individual pension funds.

The retirement benefit data includes all payments made directly to California households and does not include medical benefits or payments made directly to providers. It was compiled and reported by CalPERS at the county level through a commercially available US Post Office zip code conversion software. Those county compilations are then run against the county level data for California that is pre-assembled by IMPLAN.

The CalPERS benefits data used in the input-output modeling has been supplemented to provide context in the narrative sections of this report with additional information provided by CalPERS including a listing of CalPERS Benefit Payments by State compiled in March 2010 and the CalPERS Facts at a Glance reports on General Facts and Retirement and Membership Facts as of March, 21, 2011 available on-line at: <http://www.calpers.ca.gov/index.jsp?bc=/about/facts/home.xml>. The CalPERS funding level is as of June 1, 2011.

To measure the economic impacts of retiree expenditures made out of benefits paid to CalPERS members in California counties, this analysis utilized the latest version of the IMPLAN input-output modeling software which has been used by industry and government analysts since the 1970s. Developed by the USDA Forest Service to analyze the economic effects of local land management projects, the software is now deployed nationally to analyze impacts of highly varied local and community development projects. The model is currently the methodology required for analysis on many Federal and State public works and natural resources projects, and is widely used in Federal and State environmental impact assessments.

The IMPLAN model is calibrated for the local region using data from the U.S. Bureau of Labor Statistics Census of Employment and Wages and uses industry production functions developed by the U.S. Bureau of Economic Analysis. The Quarterly Census of Employment and Wages (QCEW) data, formerly known as the ES-202 program, is based on a survey of all businesses that file Social Security or other Federal quarterly payments and reports.

The IMPLAN data is updated every two years and the most current software utilizes QCEW data from 2009. This data may not exactly match data from other sources such as the U.S. Census Bureau, the U.S. Bureau of Economic Analysis, the California Employment Development Department, or the California Department of Finance.

If you are interested in more detail on these sources, you can find extensive background information as well as greater technical detail about the data employed in IMPLAN version 3.0 at their website: http://implan.com/V4/index.php?option=com_multicategories&view=categories&cid=241:datainformation&Itemid=10

Input-output models are economic tools to measure total economic benefits. To assess the impact of the inter-action among businesses in various sectors it was necessary to create a full model of the economy which includes all transactions between consumers and suppliers, between suppliers, and the household expenditures of the workers in each economic sector. The IMPLAN model uses a matrix to represent the economy of a region in order to estimate the impact of events in one industry or institution on all other sectors of the local economy

IMPLAN uses a Social Accounting Matrix (SAM) which captures all the transactions in a local area. The SAM describes a local economy in terms of the flow of dollars within a region while also accounting for non-industry related transactions including tax payments by business and households. This allows a superior portrayal of the household income impact on the economy than other models. The IMPLAN model must be calibrated for each local economy in which impacts are to be measured. The calibration creates a model for the local economy which shows all of the productive sectors, and measures the interconnections between them.

This is the first time that this version of the IMPLAN model has been used to analyze the impact of pension payments in a state, regional or local economy and the outputs are not comparable to previous studies. Although there have been a wide range of similar economic impact studies by other pension funds over the last decade it is important to not draw conclusions based on comparisons among the various studies. Because different data sets are employed at different times for each study, older versions of IMPLAN were used, and sometimes other methodologies are utilized, each study must be approached as an indication of a specific impact in a specific situation at a specific point in time.

This study does not measure net economic impacts because of limitations on available data. It focuses on the gross economic impacts of pension benefit expenditures in one year rather than cumulative effects over time. Accurately accounting for the net economic impacts of pensions would require a dynamic model and data that spans several decades.

North American Industry Classification System

The North American Industry Classification System or NAICS (pronounced "nakes") is used by business and government to classify business establishments according to type of economic activity (process of production) in Canada, Mexico and the United States. It has largely replaced the older Standard Industrial Classification (SIC) system; however, certain government departments and agencies, such as the U.S. Securities and Exchange Commission (SEC), still use the SIC codes.

An establishment is typically a single physical location, though administratively distinct operations at a single location may be treated as distinct establishments. Each establishment is classified to an industry according to the primary business activity taking place there. NAICS does not offer guidance on the classification of enterprises (companies) which are composed of multiple establishments.

Percentage of California Industries in Primary NAICS Classifications as of 2008

This pie chart shows the order of magnitude of the primary NAICS classifications is the same when run via IMPLAN or other methodologies, but the specific impact differs over time and according to the data and model utilized. The 2009 data in the IMPLAN model run on CalPERS retiree payments indicated that real estate was down to less than 15% and manufacturing had risen to more than 11% but the rest of the sectors were comparable.

Researchers and Authors

This study is the seventh in a series of pension fund economic impact studies undertaken by the California Public Employees Retirement System since 2005. Four of those studies have been overseen by Dr. Robert Fountain, Professor Emeritus at California State University, Sacramento.

Dr. Fountain is the founder of the CSUS Applied Research Institute and the Sacramento Regional Research Institute, both of which focus on regional economic development, land use planning, and economic analysis and forecasting. He is currently the director of Regional Economic Consultants based in Benicia, CA where he focuses on economic development analysis, including data and policy analysis performed for local governments, community development agencies, and housing and redevelopment agencies. He holds a Ph.D. in Urban Land Economics from UCLA and his expertise includes economics, land use, financial planning, modeling, and forecasting.

Dr. Fountain coordinated all the research and is the principal author of the study. He was assisted in writing and editing the study by Michael W. Perri, the director of the Benefits Research Group at Lincoln Crow Strategic Communications. Perri is a former journalist with policy experience in employee benefits, pensions, health care, water, land use, education, and public finance. He has worked on previous studies for CalPERS, the California State Teachers Retirement System, and the State Association of County Retirement Systems.
